for the technological progress in communication technology it is necessary that the advanced studies in circuit and software design are accompanied with recent results of the technological research and physics in order to exceed its limitations this book is a guide which treats many components used in mobile communications and in particular focuses on non volatile memories it emerges following the conducting line of the non volatile memory in the wireless system on the one hand it develops the foundations of the interdisciplinary issues needed for design analysis and testing of the system on the other hand it deals with many of the problems appearing when the systems are realized in industrial production these cover the difficulties from the mobile system to the different types of non volatile memories the book explores memory cards multichip technologies and algorithms of the software management as well as error handling it also presents techniques of assurance for the single components and a guide through the datasheet lectures

the refereed proceedings of the 12th asia pacific computer systems architecture conference are presented in this volume twenty six full papers are presented together with two keynote and eight invited lectures collectively they represent some of the most important developments in computer systems architecture the papers emphasize hardware and software techniques for state of the art multi core and multi threaded architectures

the revised second edition of this respected text provides a state of the art overview of the main topics relating to solid state drives ssds covering nand flash memories memory controllers including booth hardware and software i o interfaces pcie sas sata reliability error correction codes bch and ldpc encryption flash signal processing and hybrid storage updated throughout to include all recent work in the field significant changes for the new edition include a new chapter on flash memory errors and data recovery procedures in ssds for reliability and lifetime improvement updated coverage of ssd architecture and pci express interfaces moving from pcie gen3 to pcie gen4 and including a section on nvme over fabric nvmf an additional section on 3d flash memories an update on standard reliability procedures for ssds expanded coverage of bch for

ssds with a specific section on detection a new section on non binary low density parity check ldpc codes the most recent advancement in the field a description of randomization in the protection of ssd data against attacks particularly relevant to 3d architectures the ssd market is booming with many industries placing a huge effort in this space spending billions of dollars in r d and product development moreover flash manufacturers are now moving to 3d architectures thus enabling an even higher level of storage capacity this book takes the reader through the fundamentals and brings them up to speed with the most recent developments in the field and is suitable for advanced students researchers and engineers alike

high density nand flash storage has become relatively inexpensive due to the popularity of various consumer electronics recently several manufacturers have released ide compatible nand flash based drives in sizes up to 64 gb at reasonable sub 1000 prices because flash is significantly more durable than mechanical hard drives and requires considerably less energy there is some speculation that large data centers will adopt these devices as database workloads make up a substantial fraction of the processing done by data centers it is interesting to ask how switching to flash based storage will affect the performance of database systems we evaluate this question using ide based flash drives from two major manufacturers we measure their read and write performance and find that flash has excellent random read performance acceptable sequential read performance and quite poor write performance compared to conventional ide disks we then consider how standard database algorithms are affected by these performance characteristics and find that the fast random read capability dramatically improves the performance of secondary indexes and index based join algorithms we next investigate using logstructured filesystems to mitigate the poor write performance of flash and find an 8 2x improvement in random write performance but at the cost of a 3 7x decrease in random read performance finally we study techniques for exploiting the inherent parallelism of multiple chip flash devices and we find that adaptive coding strategies can yield a 2x performance improvement over static ones we conclude that in many cases flash disk performance is still worse than on traditional drives and that current flash technology may not yet be mature enough for widespread database adoption if performance is a dominant factor finally we briefly speculate how this landscape may change based on expected performance of next generation flash memories

flash memory devices have represented a breakthrough in storage since their inception in the mid 1980s and innovation is still ongoing the peculiarity of such technology is an inherent

flexibility in terms of performance and integration density according to the architecture devised for integration the nor flash technology is still the workhorse of many code storage applications in the embedded world ranging from microcontrollers for automotive environment to iot smart devices their usage is also forecasted to be fundamental in emerging ai edge scenario on the contrary when massive data storage is required nand flash memories are necessary to have in a system you can find nand flash in usb sticks cards but most of all in solid state drives ssds since ssds are extremely demanding in terms of storage capacity they fueled a new wave of innovation namely the 3d architecture today 3d means that multiple layers of memory cells are manufactured within the same piece of silicon easily reaching a terabit capacity so far flash architectures have always been based on floating gate where the information is stored by injecting electrons in a piece of polysilicon surrounded by oxide on the contrary emerging concepts are based on charge trap cells in summary flash memory devices represent the largest landscape of storage devices and we expect more advancements in the coming years this will require a lot of innovation in process technology materials circuit design flash management algorithms error correction code and finally system co design for new applications such as ai and security enforcement

this two volume set lncs 10602 and lncs 10603 constitutes the thoroughly refereed post conference proceedings of the third international conference on cloud computing and security icccs 2017 held in nanjing china in june 2017 the 116 full papers and 11 short papers of these volumes were carefully reviewed and selected from 391 submissions the papers are organized in topical sections such as information hiding cloud computing iot applications information security multimedia applications optimization and classification

mohammed rajab proposes different technologies like the error correction coding ecc sources coding and offset calibration that aim to improve the reliability of the nand flash memory with low implementation costs for industrial application the author examines different ecc schemes based on concatenated codes like generalized concatenated codes gcc which are applicable for nand flash memories by using the hard and soft input decoding furthermore different data compression schemes are examined in order to reduce the write amplification effect and also to improve the error correct capability of the ecc by combining both schemes
